	L3. $\Delta \vdash \neg\neg Th$	($\neg I, 2$)
	L4. $\Delta \vdash Th$	($\neg E, 3$)

Knowledge based Proof Planning

Mathematical Control Knowledge

Global mathematical control:

- Prove $|a| < b$ directly or via auxiliary variables
⇒ prove $|a| < b$ by `Solve_b`, `Solve*` or
... `LimHeuristic`.
- Use important parts of assumptions to introduce
auxiliary variables/inequalities:
e.g. `LimHeuristic` requires:
 - `Focus`
 - `UNWRAPHYP`
 - `REmoveFocus`
 - `MP-b`

Proof Presentation to the User

Verbalisation of ComplexEstimate:

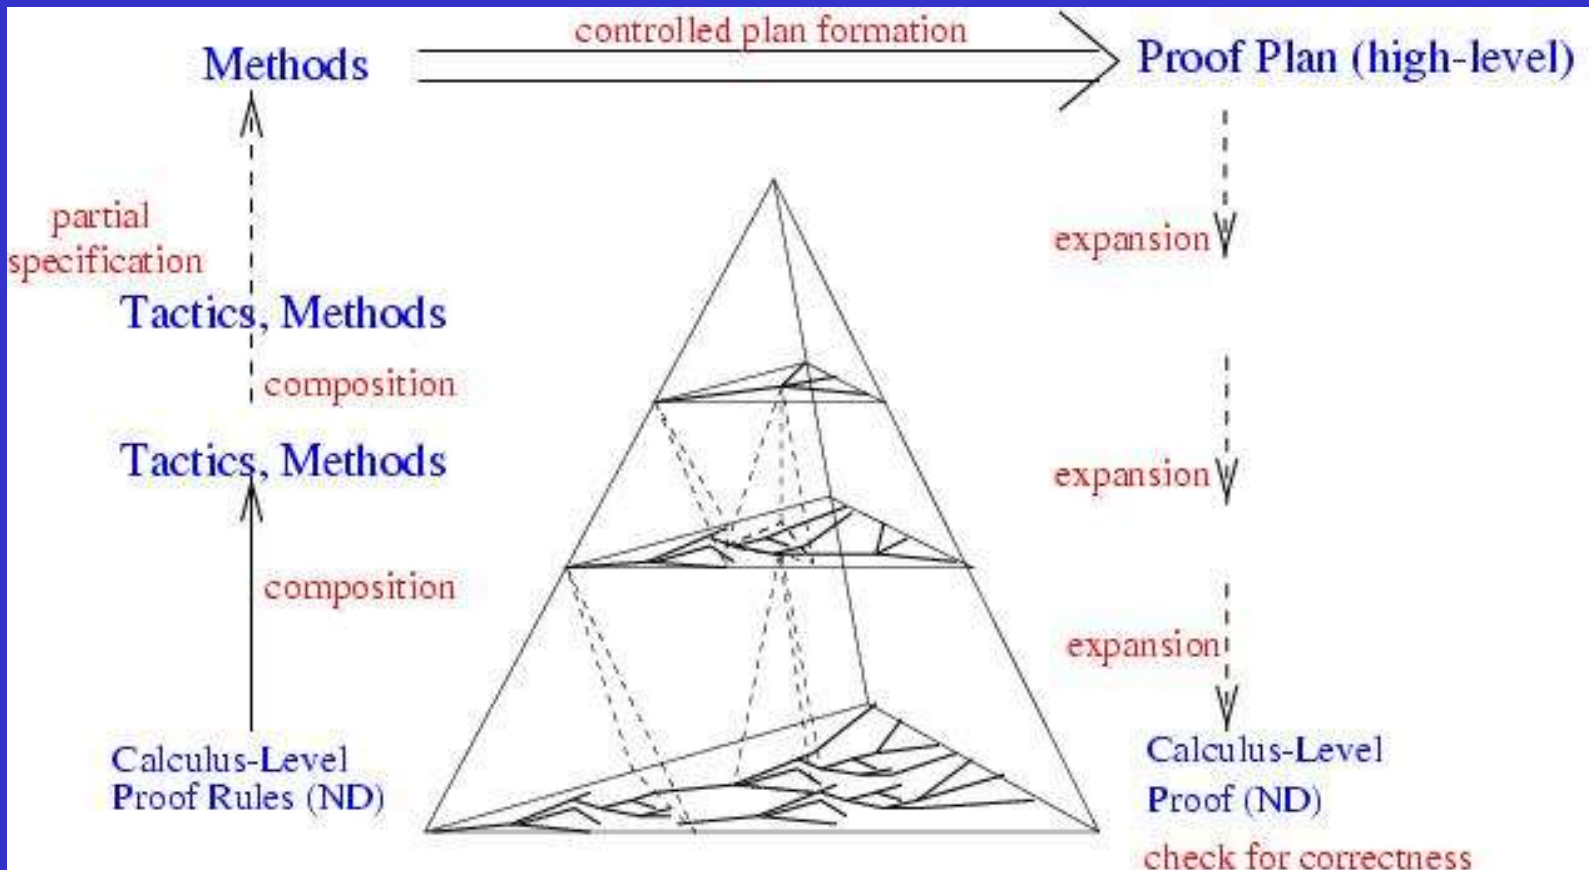

In order to estimate the magnitude of $|b|$
we rewrite the term to $|k * a + l|$
and use the Triangle Inequality $|k * a + l| \leq |k * a| + |l|$.
Now the goal can be shown in three steps:

- There exists an M such that $|k| < M$ and
- $|a| < \epsilon / (2 * M)$, and
- $|l| < \epsilon / 2$.

Then $|b| \leq |k| * |a| + |l| < M * \epsilon / (2 * M) + \epsilon / 2 = \epsilon$
and therefore $|b| < \epsilon$.

ComplexEstimate-:

In order to estimate the magnitude of $|((f x) + (g x)) - (limit1 + limit2)| < e$, we rewrite the term to $|1 * ((f x) - limit1) + |(g x) - limit2||$, and use the Triangle Inequality:

$$|((f x) + (g x)) - (limit1 + limit2)| = < (|1 * ((f x) - limit1)| + |(g x) - limit2|).$$

This goal can be shown in three steps:

1. There exists an $m1$ such that $|1| < m1$, and
2. $|(f x) - limit1| < (e / (2 * m1))$, and
3. $|(g x) - limit2| < (e / 2)$,

Then

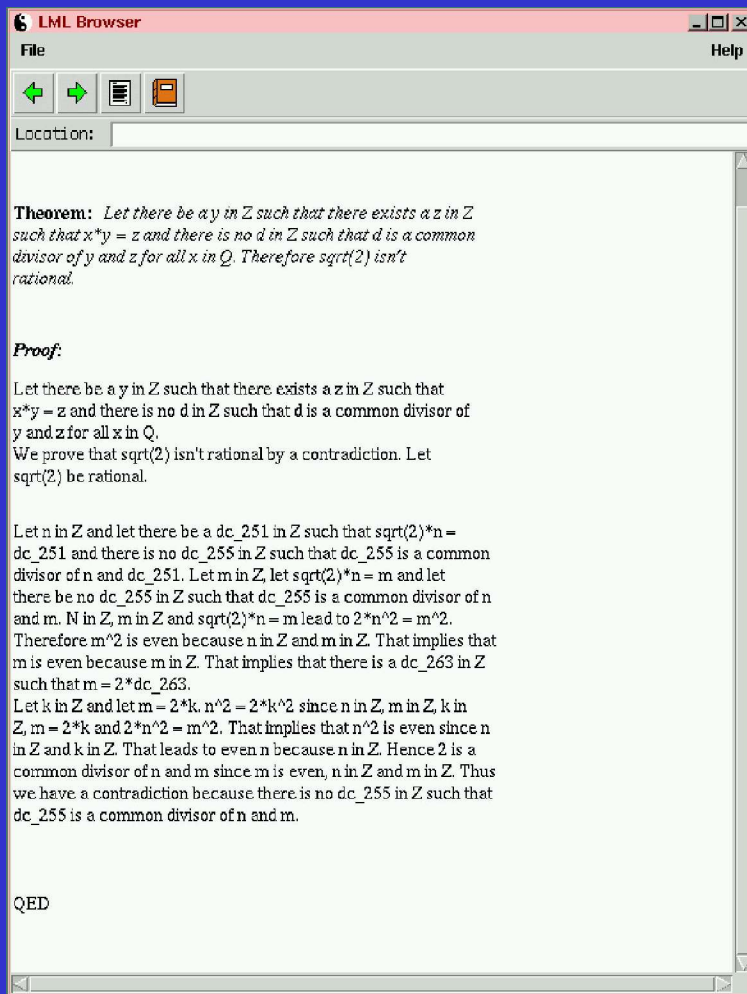

$$\begin{aligned} & |((f x) + (g x)) - (limit1 + limit2)| \\ & = < |1 * ((f x) - limit1)| + |(g x) - limit2| \\ & < (m1 * (e / (2 * m1))) + (e / 2) \\ & = e, \end{aligned}$$

and therefore $|((f x) + (g x)) - (limit1 + limit2)| < e$.
